

Be the priority: Schedule your mammogram TODAY

Among women in New York state, breast cancer is the most common cancer and the second-leading cause of cancer-related death.

Mammogram

An X-ray of the breast that can detect suspicious areas that could be signs of cancer, even when they are too small to feel.

The U.S. Preventive Services Task Force recommends women ages 40-74 have a mammogram every two years.

Some women need to start getting mammograms earlier or have them done more often.

Is it dangerous? The potential benefits of early cancer detection outweigh the risks of a small amount of radiation exposure.

Will it hurt? It can be uncomfortable for some, but the test only takes a few minutes and can save your life.

What if my results are abnormal? About 10 percent of women are called back for further evaluation.

Screening saves lives

It helps to find cancer early, when cancer is easier to treat.

40%

Black women have a 4% lower incidence rate of breast cancer than White women but a 40% higher breast cancer death rate.

89.4%

89.4% of women survive 5 years or more after being diagnosed with breast cancer in the United States.

Talk to your health care provider:

- Understand your personal risk of breast cancer.
- Decide together about when to start mammograms and how often to get them.
- Share any concerns or fears you may have.
- Discuss any changes in your breasts, including pain, lumps, new discharge, or redness.

Schedule your mammogram today.

To find a screening location near you, text "Get Screened" to 81336 (message rates may apply). If you need help finding a doctor, check with your health insurance provider.
